Grabit
Support for easy and fast cryptocurrency transactions between individuals.

Project title : Grabit

Key points :

- Support for easy and fast cryptocurrency transactions between individuals
- Number of types transaction available like P2P, Staking, Spot, Derivatives and wallet management
- Users place buy/sell orders for spot/derivatives and trade based on Binance prices.
- Blockchain transaction by tatum(third party service provider)
- Users are get extra profit from referrals when their referrer made any transactions

Grabit is a centralized wallets based blockchain project where users register and get wallets. Once wallets are generated, users can deposit coins and use various trades.

Grabit uses tatum to make blockchain transactions which make a secure environment.

Grabit provides four coin pairs (BTCUSDT, ETHUSDT, XRPUSDT, TRXUSDT) to trade with binance price. Also has a referral system that provides extra benefit from referrals based on fees set by platform.

Technologies :

NodeJs(Backend), ReactJs(Frontend), PostgreSql(Database)
